In the textbook Introduction to Solid State Physics by Landau and Lifshitz, at the beginning of chapter 7 they use the term pseudospin as the sum of the spin and pseudospin of the carriers. I've never heard of this quantity before, but then I was reading chapter 8, where they introduce the holes and the formation of the Fermi surface, and suddenly it appears as if the pseudospin of the electron contributes to the numbers. Why is this happening? A: The Fermi level is defined as the energy at which there are \$N\$ states of a given spin with energies below the Fermi level and \$N\$ states of the same spin with energies above the Fermi level. The difference in the total numbers of states of the spin \$\pm\frac12\$ for two different spin-orientations is the pseudospin. I see no need for spin and pseudospin to have anything to do with holes. Q: Undefined name'separate\_concat' I have a query that uses several joins and I added a custom page that will retrieve all of the results from my data and assign them to variables. The query does work, but I get the following error and I can't figure out why: line 25: Unexpected 'undefined name'separate\_concat' in include" I think it is a problem on my page, but I don't understand it. db->get('Requests'); if (\$q->num\_rows > 0) { while (\$c = \$q->fetch\_object()) { \$status = \$c->status; \$progress = \$c->progress; \$qtitle = \$c->qtitle; \$qdetails = \$c->qdetails; \$qnotes
