There are many ways to get feedback on your design ideas. Visual feedback is still the most common, but we're seeing more and more designers use feedback tools that allow us to incorporate their feedback into the design. That's what Markup Assist and the Insertion Log are all about. When we collaborate on a project, we work together using Markup Assist. Markups are formed, addressed, and resized, and then we turn them into imports using the Insertion Log. There are many ways to leverage the Insertion Log with AutoCAD to quickly import feedback, like printing an actual sheet of paper, importing images from popular online services, and more. You can use the Insertion Log to address different types of feedback, including: Comments on changes in the project Corresponding 2D and 3D elements in the project Suggestions for new 2D or 3D features Workflows for sharing and collaborating on designs One common scenario is to ask for suggestions and comments on a design. You might give someone an image with all of the components of your design. Or you could print out a sheet with an arrow that points to each item and ask for feedback on what that looks like in your final product. Markup Assist will allow you to import that feedback and then automatically add it to your drawing. This is another way that the new Markup and AutoLISP functions in AutoCAD 2023 allow you to quickly incorporate feedback from people into your design. Markup Assist lets you leverage a shared Insertion Log for communication, reviewing, and changes in the same way that you leverage a shared drawing history for all of the changes in your project. A finished drawing with the Insertion Log: A finished design with all of the feedback from the Insertion Log: We're also including a couple of other new tools to help you incorporate feedback from people into your designs. The Add Picture in Drawing from Picture dialog box is exactly that, a tool to help you incorporate feedback from an image into your design. For example, you can use it to incorporate feedback for how your furniture looks in a room. Just like you would import a PDF or image to a drawing, you can import a photo that represents the image for the furniture in your room. You can also import a photo of a specific view of a model that someone has shown you, allowing you to get their opinion
