3D model formats AutoCAD is able to load and save a large variety of 3D model formats. Some of these 3D formats are: STL – A file format for 3D computer model for a surface representation of a 3D solid object. STL files can be read directly into AutoCAD as DWG, DXF, or G code. OBJ – An Open CAD interchange file format similar to STL, but is based on a more robust set of file attributes. OBJ files may be written in different compression and transparency settings that STL does not support. VRML – A file format for 3D computer model for a surface representation of a 3D solid object. VRML files can be read directly into AutoCAD as DWG, DXF, or G code. VRML97 – A simplified version of VRML. SGM – A format for 3D computer model for a surface representation of a 3D solid object. SGM files can be read directly into AutoCAD as DWG, DXF, or G code. SMD – A format for 3D computer model for a surface representation of a 3D solid object. SMD files can be read directly into AutoCAD as DWG, DXF, or G code. File formats Extensible Markup Language (XML) files A .dwg file is used to exchange data between users in a modern drawing environment. It is used as a metadata file, and contains all the information that is required by AutoCAD. A .dwg file is also used to add data in a closed environment, typically used by commercial add-on applications. The .dwg file format can contain layers which enable automatic, user-defined refinement of the model. Adobe Illustrator XML Files (.ai) AutoCAD supports the .ai (Adobe Illustrator) file format, but not all features are supported. For example, the .ai format does not support layers, therefore, the imported model cannot be filtered automatically. SVG AutoCAD is able to read and write the SVG format. DGN A file format created by the AutoCAD group for the purpose of storing topological data. The data is in a tree structure similar to a directed graph. A graph is a set of vertices connected by edges. There are no vert a1d647c40b

The cyclin-dependent kinase inhibitor p21(WAF1) is the target of the p53 tumor suppressor protein and is involved in the regulation of cell cycle progression and apoptosis in response to DNA damage. We have previously reported that p21(WAF1) levels are inversely correlated with p53 in various human cancer cell lines and primary tumor specimens. In the present study, we found that the degradation of p21(WAF1) is mediated by the ubiquitin ligase, MDM2, and that expression of p53 increases the degradation of MDM2. Moreover, the E3 ubiquitin ligase activity of MDM2 is required for the accumulation of p53, and accumulation of p53 increases the level of p21(WAF1
