DotNet Code Library Crack + With Serial Key

DotNet Code Library is an advanced, yet simple code management tool for designers, developers, project managers and IT managers. It supports you with the following features: Keep your source code in a single place With your library you can store a complete project as a single file, including all files and folders of your project, so that the team knows where to find your project at any given time. Your code can be accessed from multiple workstations and you can be sure that no-one will be able to view your project file. This also means that you can easily share your project with others and keep your project in sync. With your library, you can store your project's source code in your own secure location. It could be a personal FTP server, on a website, a shared folder on the network, or even on a DVD or flash drive. It is your choice and the choice of your project manager. Your code library can be shared with others. You can also use it to backup your code and to synchronize it between your workstations. Get your code quickly: DotNet Code Library supports you with an intuitive user interface which is very intuitive and easy to use. With one click you can access your code library and quickly view all the files, folders, and source code of your project. Your code is kept in a single repository and you can choose to include the source files in your build process. Keep your code organized: You can create your own folders in your code library or use one of the popular OEPE (Open Enterprise Projects Environment) file types, for example C# or VB.NET projects, in order to keep your code organized. You can even create your own custom file types and save them in your code library. In addition, you can view and edit metadata about your source code. For example, you can create descriptive names for your classes and methods and you can define the programming language used by your source code. Edit your code in any IDE or editor: You can use your code library from any text editor or IDE. You can also edit your code files directly from the IDE using the Code Library plugin or even view the files in a browser. Back up and synchronize your data: DotNet Code Library can also be used as a secure data repository and synchronizer. You can keep your data protected and be sure that no-one can access your data. You can also backup your code and synchronize your

DotNet Code Library is a convenient way to use your favorite code snippets on the internet and share them with the world. It allows you to paste your favorite code from Google, LinkedIn, Stackoverflow, forums, blogs, etc. to a class, method or property in your solution, and insert a data-rich snippet into the same class, method or property. You can use that to quickly paste a snippet of code in a CSHTML file, a web form, a class, etc. to any type of element you can imagine. You can paste that snippet from a web page and synchronize its data with your project, or copy it from a third-party application and paste it in your project to customize the behavior of that third-party control. You can use the service to open any file from any place in the internet and quickly edit its content. You can quickly synchronize and merge several files in a project, and easily create a snapshot, backup or version history of your project. You can do it all through a simple and easy to use web interface. Last but not least, you can even share your snippets through social networks such as Twitter, Facebook, Google+, LinkedIn and so on. To create a snippet, simply paste the snippet from any online service (Google, Stackoverflow, Forums, etc.), copy the whole code and then paste it anywhere you like. To find the snippet you just created, click on the corresponding icon on the home screen of the web application, then select the right one to insert it into the editor area. You can search for your snippets in the code behind a given class, method or property, or in the entire solution. Inserting data-rich code snippets To paste data-rich code snippets, simply copy the appropriate data to clipboard then use the "Insert Data-Rich Snippet" button on the snippet screen. The copied data will appear as a rich snippet on the page you inserted the snippet in. You can also paste HTML that contains image(s) into a snippet, or copy-and-paste a URL to insert a rich snippet to that URL. Editing data-rich code snippets When you are ready to edit your code, simply click on the corresponding icon on the home screen of the web application, then select the right one to insert it into the editor area. You can also edit the data on a rich snippet through this editor window. Click on "Copy the current snippet" to save the current edited snippet. You can also delete a snippet by clicking on the corresponding icon on the home screen of the web application. Creating a new snippet To create a new snippet, simply paste the snippet you want into the main window of the web application. The new snippet will automatically appear under the "Sn
