that I am using to test a new application that will push messages to an internal Exchange server. The new application will perform the following functionality: Accept some messages from various clients Process the messages Push the messages to a shared Exchange account Each message will have a unique id, header data, body data, and have attachments. The app will be written in C# and .NET 3.5 The app is very simple in its functionality. It will only be used to validate delivery of messages and will not have the ability to change the messages themselves. The problem I'm facing is Exchange server mailbox size. I've verified that I'm limited to a mailbox size of 2GB which is causing me some problems. I'm currently using Exchange 2003, but will upgrade to Exchange 2007 in the near future. I'm having difficulty finding out if there is any advantage to moving to a new version of Exchange and if so, if it is worth the cost. I don't currently have any information on a migration plan to Exchange 2007 a1d647c40b
