The autoCAD Architecture A recent design of a city map with a simple house in the background, as viewed with the maptool A QuickTime movie showing the architecture of AutoCAD. A use case is to create the architectural drawings in AutoCAD, then convert them to AutoCAD mechanical (IFC) format, and then to CNC machines or other fabrication centers to be printed or engraved. The AutoCAD mechanical (IFC) format is an XML-based industry standard format used by Autodesk for

manufacturing, construction and electrical industries. Many software applications are designed to run on one computer, or on a very limited number of computers connected to a network. In contrast, AutoCAD is designed to run on any computer with a computer graphics card. When you use AutoCAD on a computer with an integrated graphics card, the computer actually acts as a display for AutoCAD. You can interact with AutoCAD on the computer as if you were actually working with a mouse. When you run AutoCAD on a computer with an internal graphics card, the graphics card actually generates the display and the drawing area. AutoCAD was originally designed for CAD operators who use their own personal computers. Each CAD operator can now be a specialist. A number of CAD operators could also work from a central CAD hub. In this way, a CAD operator could work from any of a number of different machines, with several drawings to be created. But with the advent of desktop publishing, non-CAD operators and/or non-CAD operators have also become involved in the design process. The common task of copying and pasting blocks into a new drawing can be done by a non-CAD operator. The non-CAD operators can be specialized in a number of different

---

domains. For example, a non-CAD operator can be a specialized designer and drafter. He or she can be a specialist in brickwork or a specialist in swimming pools. As AutoCAD becomes increasingly used by a broader group of users, more and more non-CAD users are involved in the design process. AutoCAD can be run on a network in either client-server or peer-to-peer mode. AutoCAD can also be run on a local network connected to a single computer. A common use case for a local network is when a large corporation, school or

A federal judge in Texas who was held hostage in August by gunmen who threatened to kill her and shot at her attorneys and other court officials has been awarded \$10 million in a lawsuit against the group of masked gunmen. U.S. District Judge Sandra Pechman ordered the payment following a civil trial held last week where a forensic psychologist testified that the threats made against the judge were so serious that the gunmen posed a “direct, present and imminent threat to her safety.” The gunmen stole a government vehicle carrying three of Judge Pechman’s attorneys in August while she was in the middle of a public court session. The vehicle was then hijacked. The men threatened the judge and ransacked her office, grabbing cash and government property and injuring a bailiff and a former FBI agent. The ruling had been previously delayed and the judge indicated that the seven-year-old civil case could not be resolved by the court, so the decision to award the \$10 million is no small victory. The trial took place in a special court room, with armed FBI and SWAT personnel providing protection. The jury took just

five hours to reach the verdict. The gunmen were later arrested and convicted of federal crimes. They range from being out-of-state residents to being U.S. residents, and are not affiliated with Islamic terrorist groups. The gunmen said they were upset with the judge's decision on the immigration case of a Palestinian man. Judge Pechman, 65, a federal judge for 26 years, also faced death threats when the gunmen burst into her office. Her staff, however, was never harmed. The gunmen appeared to be members of an anti-immigration group and had the group's a1d647c40b
