I need to generate unique times in this audit category and can only see these two options: The options below are for conducting meta activity 'timestamp' Submit a suggestion Reject a suggestion View proposal View answer Edit my answer Submit an edit View edit Accept an edit Reject an edit A: The "timestamp" you see is an audit (based on the new rules implemented recently), they are randomly generated. For any multi-user action, there will be three users logged, which will always be different. As far as the Triage audits are concerned, they too are randomly generated as per the new rules, and since it's only one action of rejecting an answer, it will be randomly generated among the eligible users on that day as per the new rules. What I have done is created a new python script that will help us to generate a random numeric value based on either a certain timestamp or a random one using some seed. def rndm(minValue, maxValue, seeder = None): """Generate a random number between minValue and maxValue given seed.""" return int(random.gauss(minValue, maxValue)) From the script you get a random timestamp or random number for further use (the logic remains the same either way). I am posting this just in case anyone else comes up with a solution by themselves. Q: Taking a screenshot of a Web Site I have a web app which is hosted in my computer. I am talking about the one who shows all the information when you click on a button. I want to take a screenshot of this info on the Web App itself. Is there an option for this in java or any other thing? A: you can use WebDriver or just use any screenshot taking

This allows us to examine the trading and investing community and their chances of surviving into their retirement, which could be coming up sooner than most of us think. With this in mind, here is a look at the top 5 retirement programs for investors. The following are some of the top 5 retirement programs for investors that we will cover in more detail in the review. 1. 401k The 401k program has become the number one choice for retirement programs with nearly a quarter of the population having a 401k available to them. This is an excellent way for investors to accumulate an emergency fund and save for their retirement. With the 401k, you can also create more than one account, which allows you to organize your money in a way that is easy to understand. The program allows you to make tax-deferred contributions which reduces the amount of tax that your taxes in the future. 2. Individual Retirement Account An IRA is very similar to the 401k account that is available to investors. You can choose to put your money in either of these two types of accounts, with many investors choosing to have both of them. Unlike the 401k, you will be able to make tax-deferred withdrawals, which can save you money in the long run. 3. Pension Plans Just like the 401k and IRA accounts, pension plans are great for investors to save for their retirement. The most popular plan is the defined benefit plan, which is becoming less popular due to the recent economic changes. This is a plan where you are guaranteed a set amount of money each month. This allows you to take retirement without any kind of uncertainty. 4. Annuities

I want to select data and do a calculation. The checkboxes are dynamic. I need to prevent multiple rows to be selected at once. I have tried this one, 4.4 5.0 4.5 5.0 \$('#check1').click(function() { if (\$(this).is(':checked') && \$('checkbox-1').not(this).is(':checked')) { alert('in'); } else { alert('out'); } }); Here I have to check on all the checkboxes if one of them is already checked. Is there any way to optimize this code?  
EDIT: Need it to work on jquery 1.5.1 A: This works perfectly with jQuery 1.5.1. HTML
