Hydrostatic transmissions, commonly referred to as "HydroFSI" systems, are well known and are a desirable alternative to mechanical transmissions in that they provide for more efficient transfer of energy between a prime mover and a load, and more specifically, a motor/generator. Such HydroFSI systems typically include a torque tube, which houses a hydraulic pump having a rotating turbine and multiple vanes, a rotating motor/generator, and a controller. The controller is typically a 3-phase inverter that receives electric current from a battery and converts the current to direct current at a

frequency that is a function of a rotating speed of the motor/generator to drive the hydraulic pump. The turbine draws hydraulic fluid from the pump via inlet/outlet lines, rotates the pump, and forces the pump to supply pressurized hydraulic fluid to the motor/generator that spins the motor/generator via a pair of hydraulic motors, which, when combined, are the load of the system. The motor/generator may or may not be balanced. HydroFSI systems are becoming more popular in the heavy duty truck/industrial markets. The driving torque range of an operating hydraulic pump/motor/generator is limited. At full load, the performance of the hydraulic pump/motor/generator is a function of the supply of water to the pump and the outlet port pressure. In addition, flow through the pump/motor/generator is limited by the hydraulic
