Getting the basics The tools in this book are all about altering images in the computer, and they apply to any photo with an image (or _layer_) or selection in it. Because they work with a raster image, you can edit an image in any format, including JPEG, TIFF, Adobe's RAW format (usually a file that's a combination of RAW and JPEG), or a special RAW format used by specific cameras. Many cameras record images with a _depth channel,_ which, as the name implies, comes at the same time as the color channels, typically in addition to a monochrome channel. This depth channel affects the picture in terms of depth, so you can use it to add background or to eliminate objects that aren't close enough to the subjects of your picture. Chapter 6 includes a detailed discussion of depth. Most cameras include a digital zoom feature that you can use to capture a wider angle of view. For most people, the best results are achieved when using a camera's native or digital zoom with lenses with a focal length of

What's New in the?

Tag: Samsung Galaxy NX We have seen various rumours and leaks regarding the prototype of the Samsung Galaxy NX, but we have never seen the device in-hand. A new report now reveals that the Samsung Galaxy NX will indeed be released as a new mirrorless camera, and it is reportedly aimed at a crowd that is bigger than the S-series. The Samsung Galaxy NX currently has no confirmed release date, but it is rumoured to go on sale as early as next month. The information came to light through a Reddit user who posted a photograph, which is of a new Samsung Galaxy NX unit that was built for the company's UK business. The handset is said to have a 1/2.3" Exmor R CMOS sensor, and it was attached to a new 20.8mm F1.7 lens. The device is almost identical to the one that was leaked earlier this year, with its design being criticised for not having a true mirrorless body. If the report is true, the Samsung Galaxy NX will be the first camera designed by the company, and it will offer much better quality than its predecessors. A mirrorless camera isn't exactly a new concept, but in the past most manufacturers have used a separate lens for each shooting situation, hence making a full-fledged mirrorless camera has been a challenge. The Samsung Galaxy S3, Samsung Galaxy S4 and the HTC One all currently offer 1/2.3" sensors and a 20mm lens, and we have seen some smartphones that have even tried to merge the feature. But this is the first time we will see a 21mm lens with a dedicated mirrorless camera. The Samsung Galaxy NX isn't Samsung's first mirrorless camera, and the company is also rumoured to have another project called the 'Samsung NX', which is a model for the Micro Four-Thirds (MFT) sensor format. The report states that the company is now planning on bringing two new mirrorless models, as part of a strategy to "diversify its mobile ecosystem". It isn't clear if the device will be able to take micro four-thirds pictures, so we won't know until we get our hands on a prototype. It is possible though that Samsung is planning on releasing both the NX and the new NX model with an MFT sensor. We are expecting to see the new
