The first version of AutoCAD was called Cricut and was designed to automate the layout of Cricut® cutting machines. AutoCAD for Windows The first version of AutoCAD for Windows was released in 1983. AutoCAD was based on the cricada, or Cricut, CAD program that was being developed by the engineers at I.D.E.A. in Cambridge, MA. In 1985, I.D.E.A. was acquired by Autodesk. a graphical programming language called VIA Visual Interface Authoring that is a graphical coding language that enables the creation of editors, macros and scripts for use with AutoCAD. Computerized drafting and design (CDD) is not a CAD program per se but a proprietary suite of software that includes AutoCAD. The term "CDD" is not an acronym; it is an entirely new term. Gantt Chart support in AutoCAD is available through customizing import and export functions to load or export a Gantt Chart in an.* format (for example, a Gantt Chart or KGanttChart file created by GAIN will appear as an.* file.) Paths Paths are like sub-drawing items or layers in a drawing. They are used to arrange items within drawings. Paths are similar to layers except that layers can be transparent, while paths cannot. Each path is a data structure that uses a native CAD format to store data. Drawings can contain a large number of paths, while path data can be edited and deleted on a path-by-path basis. The ability to create a path is also found in the file, and can be accessed by a Filter function as well as by the pencil tool. Paths are also used to create paper space curves, which are used for exporting the paper space. Paths can be used to transform objects such as groups, symbols, dimension lines, and dimensions into their final destination. Any object can be moved into a drawing or exported into a file using a path. The path can also be modified to allow the object to be moved into a different location. Paths can be linked to other objects for easy and automated path management. Paths can be grouped into a palette of path for easier management of their order and dimensions. Paths are created from an existing shape or line, by using the line tool. If a segment is selected, it will automatically be converted into a path. To close a path, select it, select the LINE command from the command line, and select "Close Path" from the context-sensitive menu. A path can also be opened as a separate, split-displayed drawing that can be edited. Paths are used by a variety of commands, including dimension, and can be associated with one of the other common drawing objects such as the Dimension Line, Symbol, and Dimension tool. af5dca3d97
