Bacillus subtilis is the Gram-positive bacterium that is most commonly used as a probiotic in food and feed. *B. subtilis* spores are heat- and acid-resistant, and upon ingestion (for example, in food or feed), the spores germinate into vegetative cells that multiply in the gut environment, and produce metabolites such as organic acids and amylase that act as acidifiers and enzymes to break down complex carbohydrates. Additionally, *B. subtilis* has been reported to inhibit pathogens through various mechanisms. For example, strains of *B. subtilis* have been shown to inhibit pathogenic *Listeria monocytogenes* via an indole production mediated mechanism (Kopp et al. (1998), *Food Microbiology* 7:237-237). Immunostimulatory effects of *B. subtilis* on human cells have also been reported. Co-culture of monocyte/macrophages and *B. subtilis* was found to increase the release of interleukin-1 beta (IL-1 β) and nitric oxide (NO). *B. subtilis* strain RBT 516 has been shown to induce lymphocyte proliferation in human peripheral blood mononuclear cells in a dose-dependent manner, and such response was potentiated by the addition of probiotic yogurt to the culture (Mizunoyama et al. (2005) *J. Nutr.* 135:1140-1146). It has been suggested that *B. subtilis* regulates immune responses through interactions with the innate immune system (Roman et al. (2009), *J. Infect. Dis.* (2009), PMID: 19314004). More recently, potential pathogen-inactivating properties of *B. subtilis* have been reported. For example, *B. subtilis* was reported to produce an extracellular polysaccharide called SpeB, which has been
